# CYCLIC COSMOLOGY

(CD)

The Law of Dynamics and Stasis

A Cosmological and Philosophical Manifesto

---

## Introduction: The Quest for the Unified Flow

Humanity has long suffered from an inherent, Earth-centric bias. We sit beneath a calm atmosphere, bathed in gentle sunlight, and foolishly employ our limited sensory organs to judge the vast mechanics of the cosmos. Mainstream science frequently falls into the trap of isolation, separating the microscopic from the macroscopic and treating extreme cosmic phenomena like black holes as anomalous, monstrous deities that break the laws of nature.

This book is a direct rejection of absolute, rigid, and isolated dogmas. It is born out of a continuous chain of thought that fuses everyday mechanical observations with advanced theoretical physics. The universe does not operate on fragmented, highly idealized formulas designed for sterile laboratory test tubes. Instead, it functions as a single, beautifully integrated, self-organizing system.

The foundational movement of nature is strictly one and the same; only its expressions are infinite. Whether observing subatomic particles or colliding galaxies, we are witnessing the exact same underlying mechanics. This book establishes a unified framework—a Cosmological Manifesto—built upon the eternal interplay of energy distribution: Give and Take, Push and Pull, Supply and Demand, Dynamics and Stasis.

By peeling back, the visual illusions of the cosmos and looking past human-centric definitions of life, we uncover a universe that is a living, breathing, and infinite circulatory system.

---

## Chapter 1: The Law of Supply-Demand and Relative Neutralization

### 1.1 The Illusion of Absolute Asymmetry

Nature operates on a fundamental duality. For every manifestation of energy, there exists an equal and opposite counterweight: Matter and Antimatter, Dynamics and Stasis, Black Holes and White Holes.

In human observations—restricted by narrow spatial boundaries and an incredibly brief evolutionary timeframe—we often fail to see this grand symmetry. We witness the terrifying, localized suction of a black hole and label it an absolute consumer. This is a severe error of scale.

Looking at the totality of the cosmic framework, vạn vật (all things) inherently drift toward a state of relative neutralization rather than absolute perfection. Absolute perfection implies stagnation; it is a dead state. True natural harmony is a *dynamic equilibrium*. Small, transient structural imbalances are not errors of nature; they are the essential gradients, the differences in potential, that prevent cosmic stagnation and keep the river of energy flowing.

### 1.2 The Sovereign Rule of Demand

Mainstream media and pop-science regularly romanticize black holes as omnipotent entities capable of devouring reality at will. This is a profound misunderstanding of physics. Without a source of "Supply," even the most massive black hole holds zero authority.

Lực hấp dẫn (gravity) does not generate power out of thin air. It is a passive, reactive geometric response to the exact mass and space compressing the system. A black hole cannot actively hunt; it relies entirely on the cosmic market of matter.

Furthermore, this market obeys a strict law of give and take. When the surrounding cosmic supply crashes into the event horizon at velocities approaching the speed of light, the sheer kinetic compression, friction, and magnetic strangulation creates a state of extreme systemic congestion. The black hole "overeats."

To maintain its relative neutralization, the system is forced to react. It cannot process the sheer volume of energy instantaneously, so it "expels toxins"—blasting colossal relativistic plasma jets and hyper-velocity cosmic winds from its poles back into the deep voids. It is a sòng phẳng (fair, transparent) transaction. The black hole consumes mass, but it is bound by the laws of the matrix to redistribute that energy back to the environment, maintaining the dynamic equilibrium of the macro-system.

---

## Chapter 2: The Water Vortex Simulation: One Fundamental Motion

### 2.1 The Unity of Physics across Scales

Mainstream academia separates physics into artificial "factions" or schools of thought: classical mechanics, fluid dynamics, chemistry, biology, and quantum physics. These divisions are entirely artificial, born from the limitations of the human eye and human instruments. When countless fundamental particles—electrons, ions, atoms, and molecules—gather, they project different visual textures at different scales. Yet the foundational motion underneath remains entirely undivided.

To comprehend the complex, macroscopic geometry of a spinning galaxy or a devouring black hole, one does not need to sit in a billion-dollar observatory. One only needs to closely observe a simple, everyday phenomenon: a full bucket of water draining through a small, circular hole at its bottom.

2.2 Deconstructing the Whirlpool

When water rushes through a narrow exit at the base of a container, it automatically organizes into a downward, spinning vortex. This everyday fluid structure is an exact analog to a cosmic black hole:

- **The Core Vortex (The Event Horizon):** As the water approaches the central drain, its rotational and downward velocity increases exponentially. Eventually, the flow speed of the water exceeds the speed of sound within that liquid medium. At this precise boundary, sound waves and tiny air bubbles are dragged down into the drain. They can never swim backward; they are physically incapable of propagating information against a current faster than their own maximum velocity. This is the exact fluid mechanics equivalent of light being trapped within the Chân trời sự kiện (Event Horizon) because the fabric of space is rushing inward faster than the speed of light.
- **Peripheral Accumulation (Galactic Accretion):** Further away from the dangerous central drain, the fluid velocity is significantly lower. Here, smaller, independent air bubbles floating on the surface are gently drawn toward one another by the inward current. They collide, merge, and form larger, stable bubbles. This perfectly mirrors the outer edges of a galaxy (rìa thiên hà), where vast, loãng (diffuse) clouds of cosmic gas

and dust are drawn together by subtle gravitational currents, condensing to birth new star systems and stellar-mass black holes.

- **The Popping of Bubbles (Supernovae):** As these compressed, macro-bubbles at the periphery experience intense fluid pressure and friction, they eventually fracture and pop, violently releasing their trapped air back into the atmosphere. This is the exact mechanical counterpart to a Supernova. A massive star, suffocated by its own internal gravitational pressure, explodes and scatters its heavy elements across the cosmic void, seeding the environment with the raw chemical building blocks necessary for future planetary systems.
- **The Terminal Dissolution:** No matter how much these bubbles fight, merge, pop, or temporarily stabilize at the outer edges, they are all ultimately prisoners of the grand, overarching fluid current. Over large scales of time, every drop of water and every surviving bubble is dragged relentlessly toward the central core, fading into the depths below. It is the definitive end of a material cycle—matter dissolving into a state of stasis, awaiting its inevitable transformation.

---

## Chapter 3: The Evolution of Black Holes: From Dynamics to Stasis

### 3.1 The Biological Lifecycle of Inanimate Giants

Mainstream astronomy treats black holes as eternal, unchanging tombs. In reality, they are deeply dynamic structures that obey the universal laws of evolution: Feeding, Growth, Maturation, and State Shift.

- **The Fragility of the Micro-Scale:** Microscopic black holes—those born with minimal mass—are highly unstable and cannot easily sustain their existence. According to quantum mechanics, the fabric of space-time experiences continuous fluctuations, causing energy to leak out from the event horizon via Hawking Radiation. For a tiny black hole, this leakage is catastrophic. It radiates away its mass so violently and rapidly that it evaporates and explodes in a fraction of a second. It lacks the gravitational "appetite" to maintain its structural matrix.
- **The Active Growth Phase (Peak Dynamics):** Conversely, if a black hole is born within a rich environment, it enters a phase of intense kinetic dominance. It devours everything intersecting its path—gas, dust, stars, and smaller black holes. With every meal, its mass escalates, and its Chân trời sự kiện physically expands outward. This is the peak dynamic phase, a state of sheer consumerism.
- **The Maturation and Starvation Phase (Thoái Trào):** No entity can grow infinitely. As a black hole consumes its local cluster, or as energy forces the universe to expand wider, the distances between cosmic structures grow immense. The black hole eventually runs out of surrounding food; it enters a state of starvation and extreme old age.

Without an incoming supply of mass, the subtle, constant leakage of Hawking Radiation begins to dominate the system. The giant slowly, over trillions of years, consumes itself. It wastes away its accumulated mass, decelerating its internal rotational frenzy, steadily shifting from an era of violent chaos (**Dynamics**) back into a deep, frozen equilibrium with the quiet background of space (**Stasis**).

3.2 The Sovereign Matrix of Space

A black hole represents the most extreme concentration of force in the visible universe, yet it remains completely subservient to its "foster mother" the fabric of Space-Time.

A popular, sensationalized view suggests that black holes are cosmic vacuum cleaners that swallow space itself. This is an ontological absurdity. **An egg cannot lay itself.** A black hole is not separate from space; it *is* space.

If you place a hyper-heavy iron sphere onto a flexible rubber sheet, the sheet warps and forms a deep, steep funnel. The sphere can pull external marbles down into its funnel, but it cannot swallow the rubber sheet itself. The rubber sheet is the fundamental matrix that allows the sphere to exist.

A black hole is simply a localized, maximum curvature of the space-time fabric. It cannot gravitationally consume its own foundational medium, nor can it swallow its own internal singularity to erase its mass from the universal balance sheet. It is bound absolutely by the strict, immutable laws of conservation of energy and the universal speed limit of light. It rules over matter, but it bows completely to Space.

---

## Chapter 4: Critique of 2026 Astronomical Discoveries: Visual Traps and Nested Universes

### 4.1 Deconstructing the "Visual Traps" of Modern Astronomy

In the year 2026, mainstream astrophysics announced a series of "revolutionary" discoveries utilizing premier instruments like the James Webb Space Telescope (JWST) and the Max Planck observatories. While the scientific community celebrated these findings blindly, a strict, logic-

oriented critique reveals that these observations are heavily distorted by the observer's frame of reference looking from Earth.

- **The Myth of the Ancient Star-Hole (Abell2744-QSO1):** Mainstream reports claimed to discover an ancient primordial black hole containing an impossible 2/3 of its entire galaxy's mass, completely upending traditional models of galaxy formation. However, academia failed to account for the geometric visual trap known as **Gravitational Lensing**. This ancient system sits directly behind a colossal, hyper-dense foreground galaxy cluster. The massive gravity of that cluster acts as an imperfect cosmic magnifying glass, severely warping the space-time path of the incoming light. It splits, magnifies, and distorts the single background object into multiple deceptive visual replicas. What humans are observing is a massive optical illusion—a mirage of scale.
- **The Triple Supermassive Merger (J0148-4214):** The discovery of a galaxy containing three supermassive black holes swirling together was heralded as an anomalous marvel of cosmic luck. In truth, this is a predictable manifestation of fluid dynamics on a galactic scale—**three bubbles caught in a giant whirlpool**. During the chật chội (congested) early eras of the universe, galaxies were physically packed closer together. Driven by pure Thiên thời and Địa lợi (the perfect alignment of cosmic time and local density), without any mystical or human intervention (Không có Nhân), these three independent systems naturally collided. Their central black holes are simply independent fluid nodes being dragged toward a new, unified center of mass.

4.2 Matryoshka Cosmology and the Failure of Static Simulators

The intuitive realization that the universe operates as a nested, recurring structure aligns perfectly with the advanced mathematical framework of **Black Hole Cosmology**.

Our entire observable universe possesses a total mass and radius that perfectly satisfy the Schwarzschild metric of a supermassive black hole. We do not live in an empty, open void. We live *inside* the event horizon of a black hole that belongs to a larger, parent universe. The primordial Big Bang was not the magical birth of time out of nothing; it was a "quantum bounce" occurring inside a dying star in that parent reality.

**Consequently, the black holes rotating within our own galaxies are not dead ends; they are currently compressing matter to trigger localized Big Bangs, incubating nested baby universes within their own hidden dimensions—an infinite, recursive chain of cosmic inheritance.**

This grand, self-generating expansion demonstrates why human engineering has hit a wall, exemplified by the official shutdown of the **Large Hadron Collider (LHC) at CERN on June 29, 2026**.

Humans spent billions building a static, 27-kilometer underground pipe to smash ions together, arrogantly believing they could replicate the absolute origin of the universe. They failed because their experimental matrix is geometrically suffocating and entirely static.

A laboratory pipe can compress matter, but it can never replicate the dynamic, self-generating fabric of expanding cosmic space. One cannot use a rigid, static formula or a microscopic lab bubble to bind the grand, evolving vortex of the universe. The universe cannot be faked inside a closed cage.
